

AI Transformation – Technical Test Pack

Objective

Evaluate the candidate's ability to design and build a practical AI-powered solution using a simplified enterprise stack. The test focuses on data handling, automation, AI reasoning, and governance practices.

Scenario: Billing Validation Prototype

You are provided with datasets representing timesheets, contract rates, and billing reports. Your task is to identify discrepancies and flag errors before invoices are sent to the client.

Provided Dataset

- 1 timesheet.csv → Contains employee hours worked per project
- 2 contracts.csv → Contains contractual rates and max allowed hours
- 3 billing.csv → Contains actual billed hours and rates
- 4 Use these datasets to identify discrepancies such as overbilling, rate mismatches, and contract violations

Requirements

- 1 Load and process input data (CSV or Excel)
- 2 Compare expected vs actual billing values
- 3 Identify discrepancies such as rate mismatches, missing hours, and overbilling
- 4 Generate a clean output dataset with flags (OK / ERROR)
- 5 Automate the workflow (Make.com or Python)
- 6 Use AI (OpenAI / Claude) to explain discrepancies and suggest corrective actions
- 7 Provide results via a simple interface (optional but recommended)
- 8 Deliver the solution via a structured GitHub repository

GitHub Deliverables

- 1 Organized repository structure (data, scripts, prompts, workflows)
- 2 README file with clear explanation and instructions
- 3 Version control with meaningful commits

Bonus Challenge

Design your solution so it can support multiple clients with different contract rules without requiring code changes.

Scoring Criteria

Area	Weight
Problem Understanding	20%
Data Logic Accuracy	25%
Automation Design	15%
AI Usage	15%
Code Quality	10%

GitHub Usage	10%
Documentation	5%
